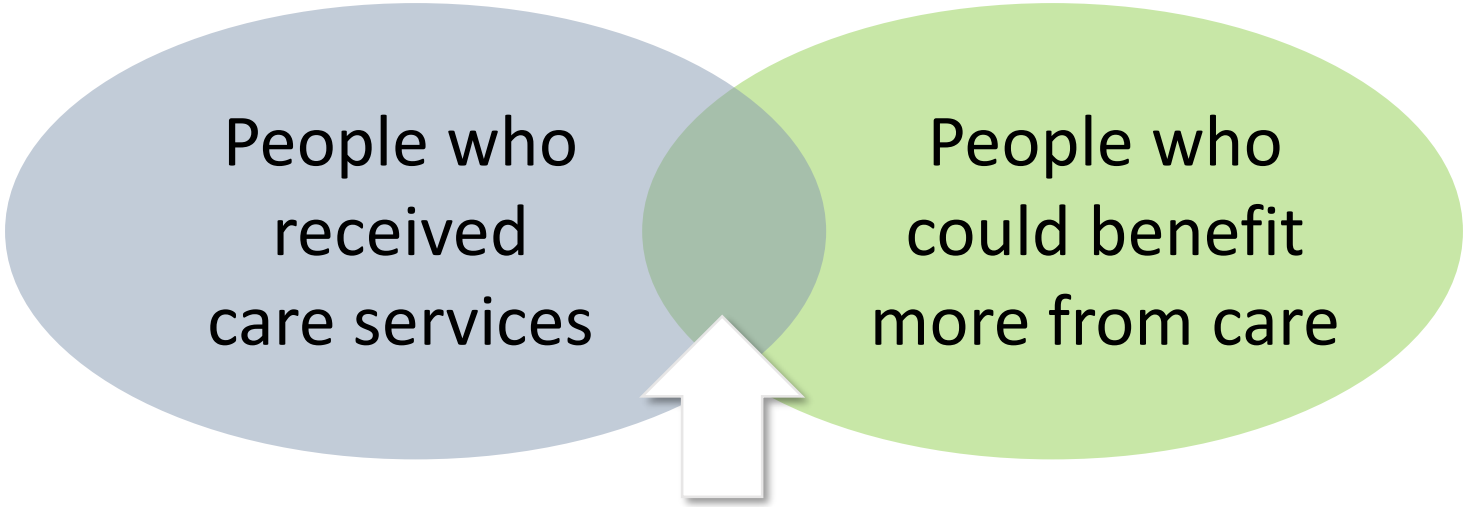
From a population perspective, the first stage in optimising value is the resource allocation process. Allocative value is optimised when it is not possible to switch resources from one budget to another and get more health for the population as a whole. As emphasised in a previous article, resources are traditionally allocated to institutions, to health centres and hospitals for example, but increasingly resource allocation to different subgroups of the population is coming up the agenda, driven in no small part by the Commissioning for Value Packs of NHS RightCare.[1] Allocating resource to programmes allows a much clearer understanding of what happens when resources are switched from one programme to another, using the method called marginal analysis the origin of which is entertainingly described in the free RAND book called *How much is enough*.[2]

in the United States, in particular, within Accountable Care Organisations. The value-based payment relates the outcomes of the patients treated to the resources used in their treatment. However, the meaning of the term value is different in the United States than in the United Kingdom.[3–5]

The patients' outcomes and the costs of patient treatment are the two elements in the American definition of value, but in the United Kingdom this would count as efficiency because when looking at the resources that have been used, it is essential for any jurisdiction responsible for a population to identify people who have not been treated and to identify people who may have been treated but have got less value from the service than would have been realised if those resources had been used for the people in greater need who missed out on treatment. The rela-



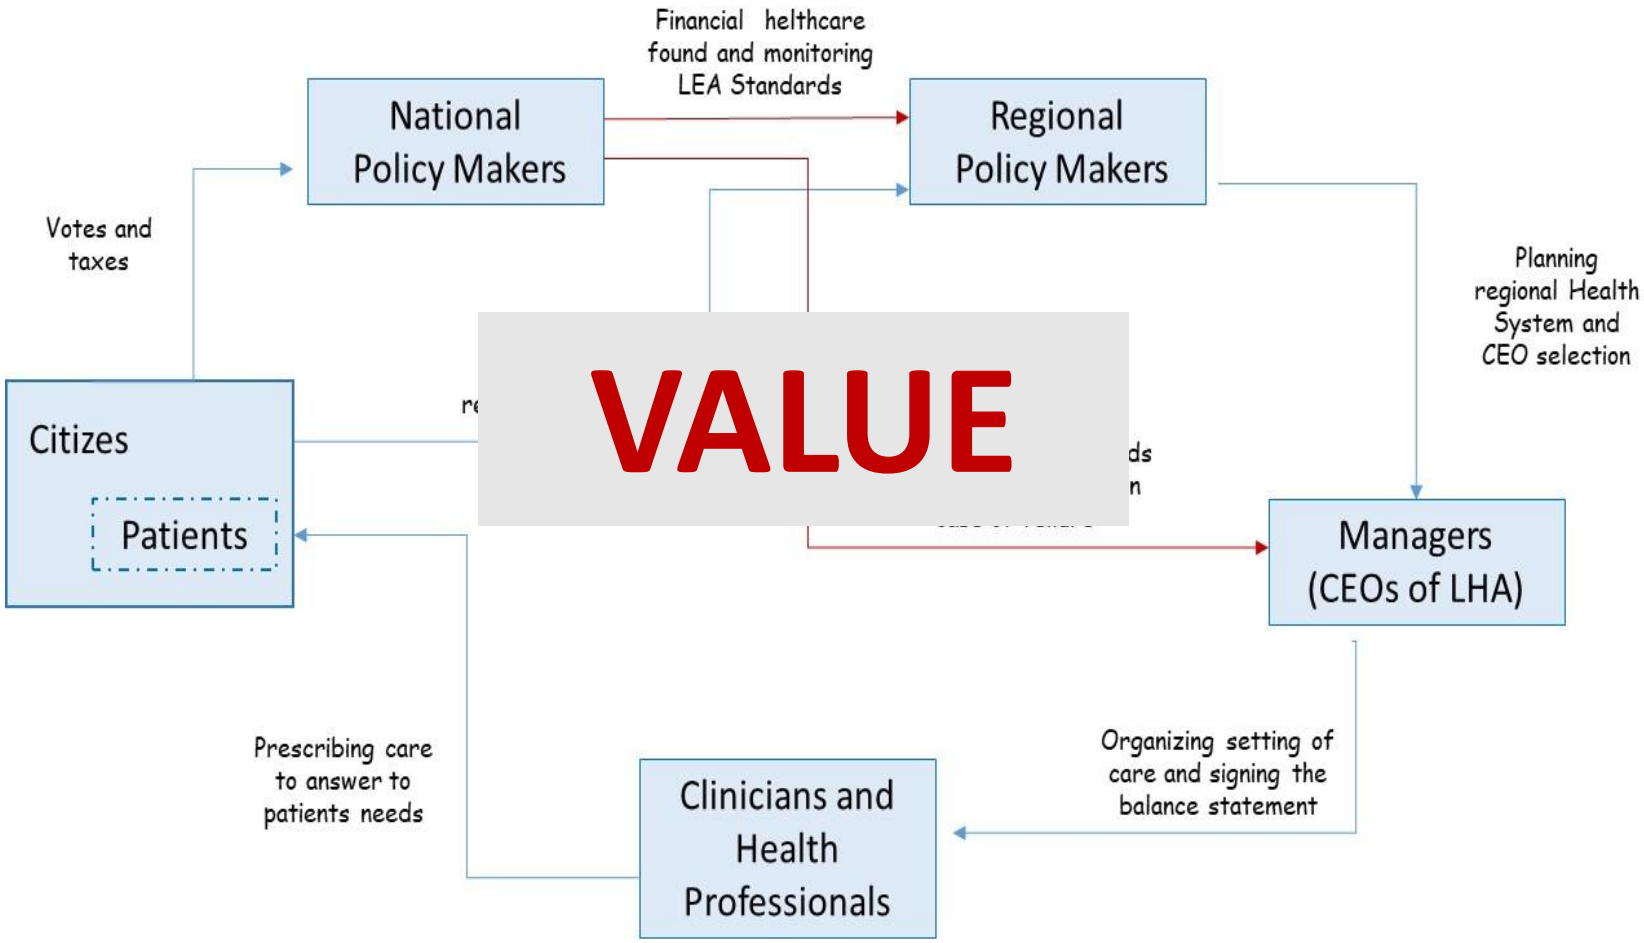
POPULATION VALUE

The Italian healthcare system

It's a *Beveridge-like model*: Universal, Comprehensive (almost), Free, Financed by general taxation.

It is organized in three levels:

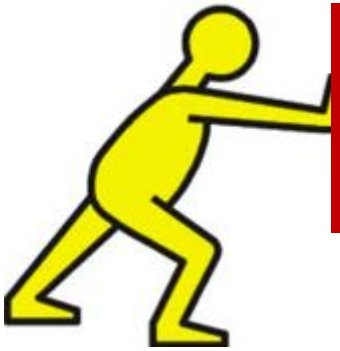
- The national level is responsible for national health planning, including general aims and annual financial resources and for ensuring a uniform level of services, care and assistance (LEA).
- The regional level has the responsibility for planning, organizing and managing its health care system through LHA's activities in order to meet the needs of their population.
- The local level (Local Health Authorities): provides care through public and/or private hospitals, primary care and prevention services.



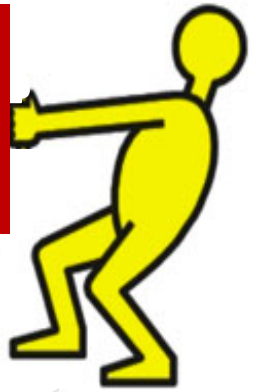
Financial helthcare found and monitoring LEA Standards
National Policy Makers
Regional Policy Makers
Votes and taxes
Planning regional Health System and CEO selection
VALUE
Citizes
Patients
Managers (CEOs of LHA)
Prescribing care to answer to patients needs
Clinicians and Health Professionals
Organizing setting of care and signing the balance statement

The national level duty is granting that **essentials levels** of care are uniformly guarateed across the country.

It should therefore monitor that each Region reaches **minimum thresholds** in terms of quality and appropriateness.

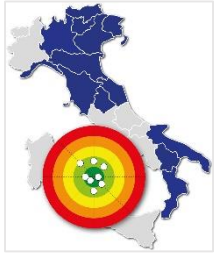


Performance



The regional level is responsible for organizing healthcare provision in order to maximize value for money.

Performance evaluation is therefore aimed at detecting **best practices**, in order to spread the most effective organizational solutions, trought **target setting**, **public disclosure**, **reward system**, working on employees motivation and comunication to assure system improvement.



Performance evaluation at the Italian national level

- National Healthcare Monitoring System (Nuovo Sistema di Garanzia PDTA by MoH)

  →STANDARDS FOR ESSENCIAL LEVELS OF CARE (30 national indicators):

  80% national goal for femur fracture operated within 48 hours, minimum level 55%

- National Program Outcomes (Piano Nazionale Esiti promoted by AGENAS http://pne2017.agenas.it/)

  → OUTCOME MEASURES FOR SINGLE PROCEDURES

Performance

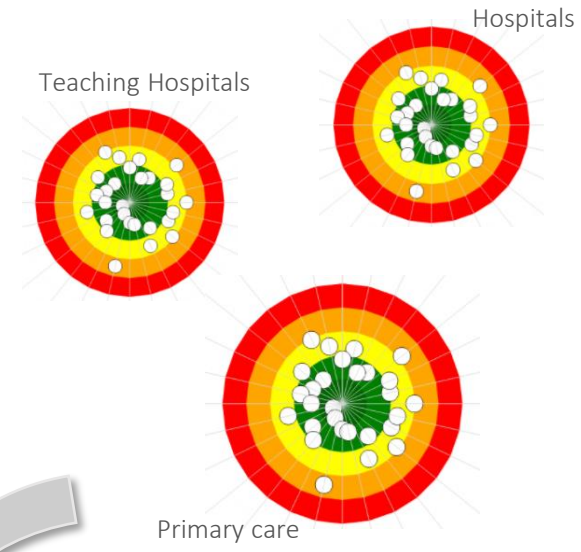
THE PERFORMANCE EVALUATION SYSTEM MUST OVERCOME THE SILOS PERSPECTIVE….

Let's play the patient's music….

the positive metaphor of the "stave"

The stave, as well as the dartboard, relies on the five colour bands (from red to dark-green). These bands are now displayed horizontally and are framed to represent the different phases of care pathways. This view allows users to focus on strengths and weaknesses characterizing the healthcare service delivery in the different pathway phases.



From Siloes to Pathways

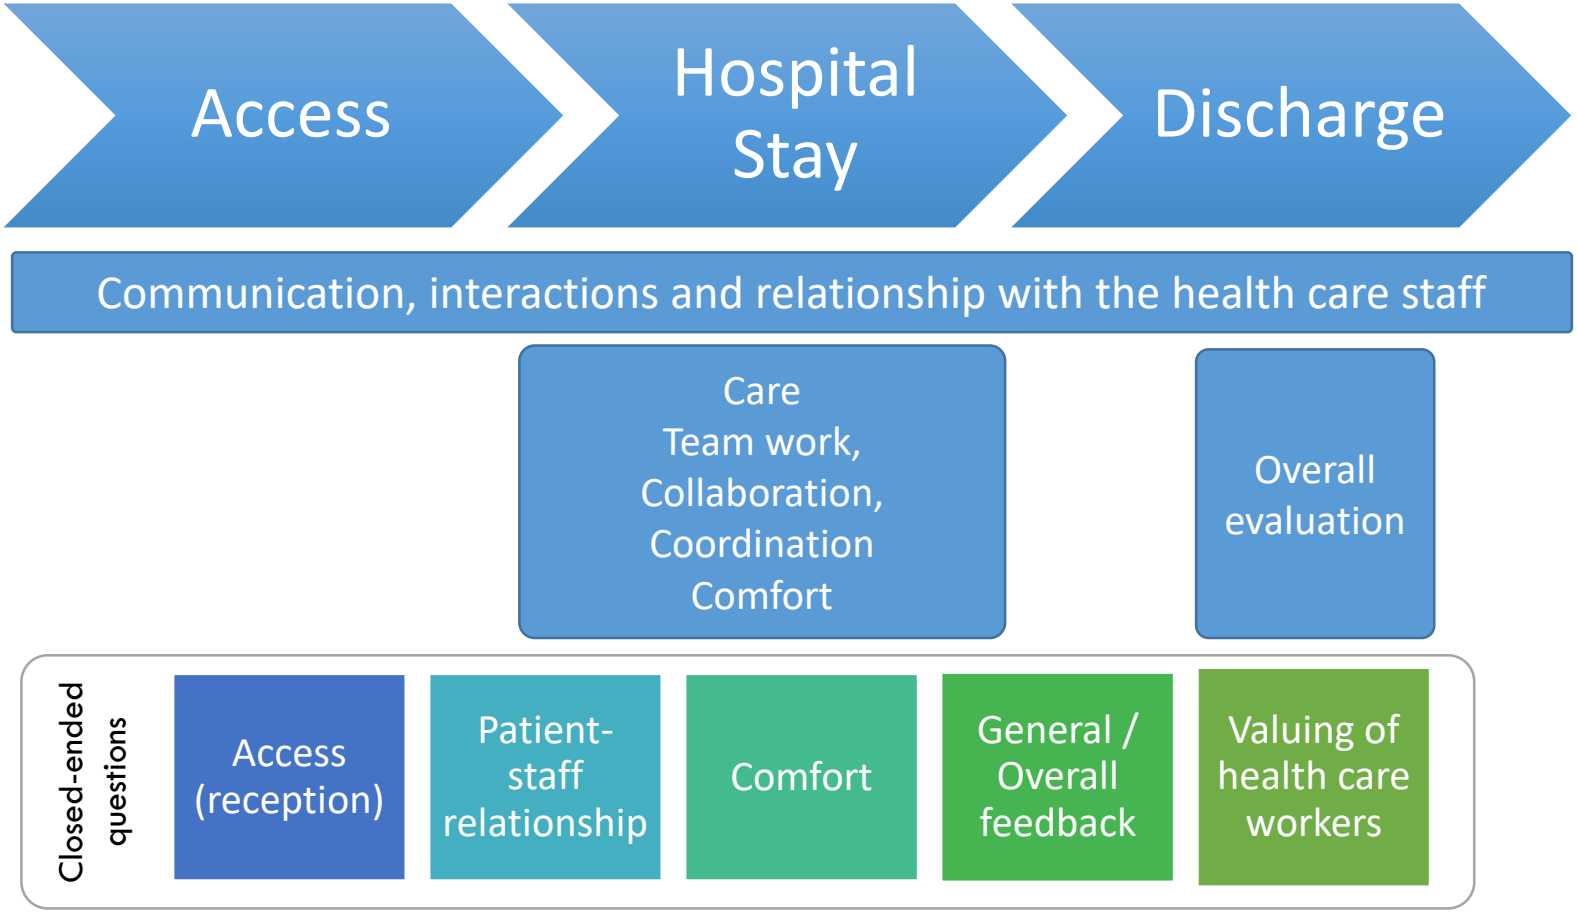
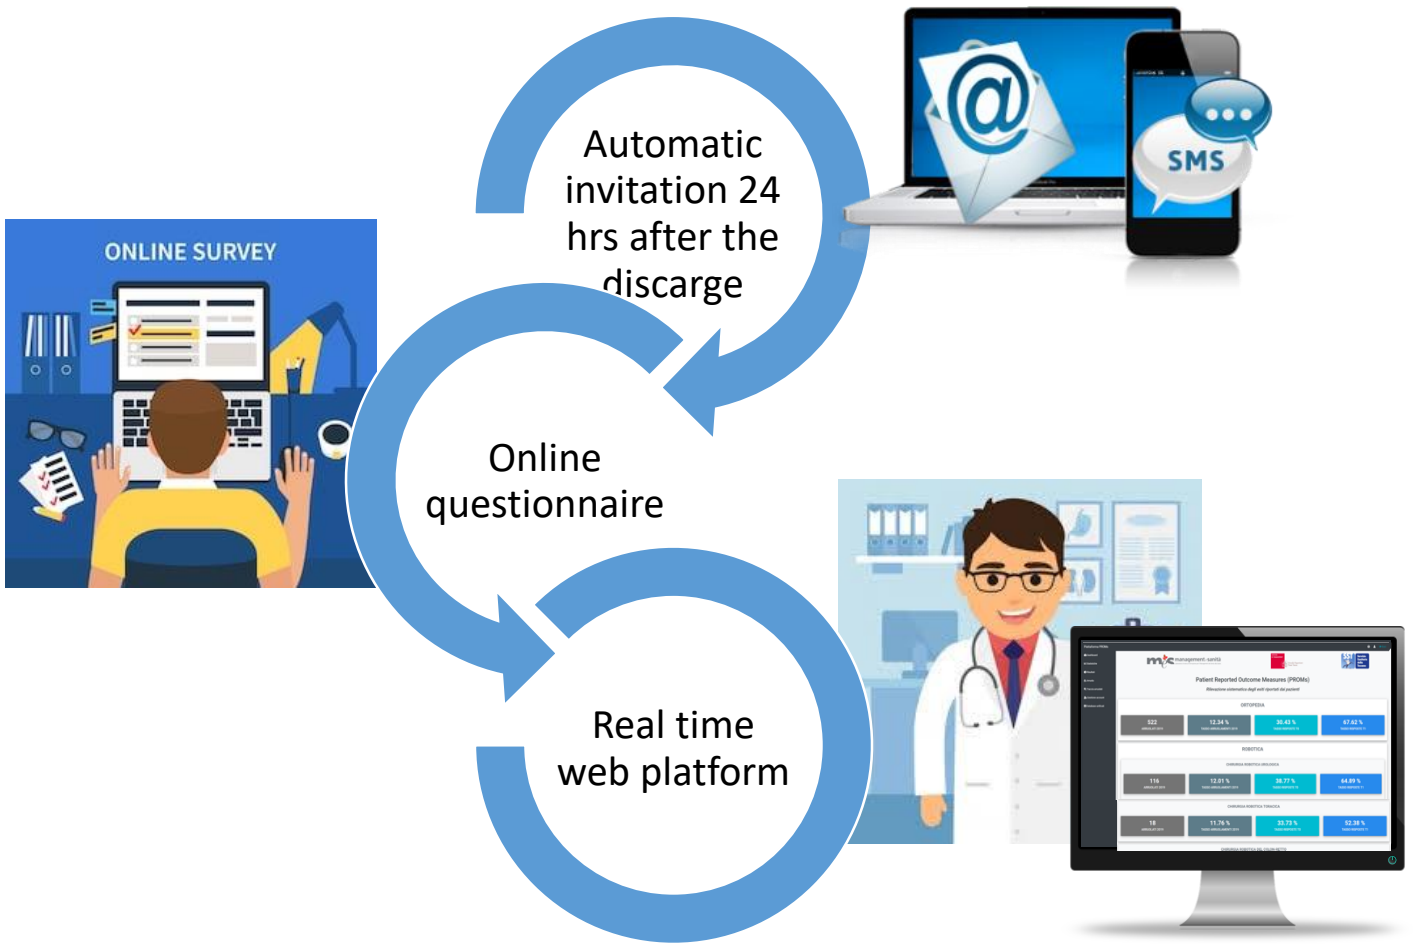
The Questionnaire Follows the **Patient Experience Journey**



The «Next Generation» Surveys

Systematic, open and continous survey



The «Next Generation» Surveys

New **questionnaire, more narrative and briefer**

Patient satisfaction

A broad and multi-dimensional concept influenced by personal preferences, expectations, personal characteristics. No consensus about exactly which domains should be included

Patient experience

Patient are asked to report about their experiences on what actually occurred

Patient reported outcome measures

Standardized validated instruments to measure patients' perceptions of their health status (impairment), their functional status (disability), and their health-related quality of life (well-being)

Patients' Narratives – Storytelling

Acknowledgement that patient stories – the illness and experience narrative – that arise from personal encounters of patients with health and social care, should be the dominant voice.

Listening to patients' stories is important, but the challenge for health professionals is to **find ways of using these narratives** to improve practice and the patient experience

Sometimes a picture is not worth a thousand words — or even a few sentences. So it appears for the public reporting of patients' experiences with doctors and clinics. Millions of dollars have been invested in the collection of standardized, quantitative measures of patient experience and in reporting them with the use of colorful icons that highlight the best and worst performers.[1] However, consumers' use of these measures remains limited because of a lack of timely exposure, doubts about the trustworthiness and relevance of metrics, and the complexity of reports and websites that incorporate multiple ratings.[1-4] By contrast, websites like Yelp and Angie's List, which present volunteered comments about service providers, including clinicians, have burgeoned over the past 5 years.[5-7] By 2013, 31% of Americans had read patients' comments online, and 21% used them when selecting a clinician — half again as many patients as report using results from standardized patient experience surveys when making a selection.[8] A parallel pattern is evident among clinicians. Written comments, in settings where they are currently available, are often seen by physicians as the most useful and meaningful form of patient feedback.[9]

The proliferation of patient comments about clinical encounters, described in their own words, was greeted skeptically by some clinicians, who worried that they were little more than a litany of grievances.[10,11] Because most volunteered comments (hereafter "comments") are actually positive, these concerns were largely unfounded.[6,12] Our own research, however, reveals a different potential downside: comments can divert attention from other vital measures of clinician performance.[13]

At the same time, qualitative reports from patients about health care represent an essential missing link both for consumers seeking to understand the experience of other patients and for physicians seeking to learn from patients to improve quality.[14,15] The incorporation of narrative feedback into public reporting can highlight aspects of quality that are missing from conventional surveys.[12,16] In addition, elicitation of narrative feedback can encourage participation in patient experience surveys by allowing consumers to report what matters most to them.[17-19]

Including carefully elicited patient accounts (hereafter "narratives") as a core component of the assessment of patients' experiences would enhance the value of patients' comments. Patient narratives would be especially valuable if they were elicited and reported with the same scientific rigor already accorded to closed-ended surveys.[15,20] We make the case here for this approach by exploring the opportunities and challenges associated with embracing patient narratives and by considering what rigor means when it is applied to qualitative accounts.

THE ESSENTIAL ROLE OF PATIENT NARRATIVES

Patient narratives can improve health care quality beyond what conventional report cards accomplish, by better informing consumer choice and by enhancing clinicians' understanding of encounters that are considered by their patients to be problematic. A growing number of report cards present consumers with standardized metrics of patient experience along with multiple measures of clinical performance and patient safety.[8,14] However, many consumers feel overwhelmed by this plethora of information.[21] Report designers have responded with simplified presentations,[22] but this does not make the actual choice process simple: consumers still must decide how to weigh different aspects of physician performance.

Consumers approach complex choices in var-
